

## Project report

Project Title : Virtual Reality Educational Model for Computer Science Department for COVID-19 Scenario.

Student Name : VijayKumar Chatim

Professor : Under the guidance of Dr. Shard Sharma

Tools Used : Major tools used for this Project Vizard, Google 3D Warehouse, Google Sketch-up.

### **Goal and Objective of the project:**

The goal of this project is to create a virtual Reality Educational model for Computer Science Department for COVID-19 Scenario. The model consists of different scenario including general information about COVID-19, necessary precautions for students to avoid disease and finally virtual class room environment set up to join on-line class room. The virtual classroom is developed so that students and instructor can interact with each other and study together in virtual environment during emergency situation such as COVID-19. The virtual reality class room is a learning tool for modern education and for students that are enrolled in online classes and during emergency situation such as Covid-19. In the virtual system people can navigate the virtual classroom as a student or as an instructor through the use of keyboard inputs. When the student tries to login for a class, there will be a message appear for welcome of student. Then they ask for the User-id and password. The students can chat with instructor and with other students using a chat box. In this project animations and interactivity were added to the environment through a variety of techniques. In the environment under Covid-19 scenario, different techniques are shown so that every student should aware of COVID-19situation.

Vizard scripts (in Python language) are used to animate students walking and chatting with each other. Collision detection was implemented through simple vizard scripts to keep users passing through university buildings and other objects in the environment. The environment created in this project is close to a Covid-19 scenario. The Virtual Classroom model environment is created in a Google 3D model and exported to WorldViz Vizard, which constitutes the base of this application. The University wellness center with emergency equipment environment is also created in a Google 3D model and exported to WorldViz Vizard. In the virtual class environment scene is created, students are given information about Covid-19 and necessary precautions to avoid accidents. In the Virtual Classroom, the students will be able to interact with fellow students. Two videos regarding basic information of Covid-19 and its necessary precautions to avoid scenarios are implemented. In the virtual classroom training scenario, on the client side, the user will be able to log into the server as an avatar of his/her choice through a login window. They will also see the avatars of fellow students and teachers logged in the environment with a name label popup. In the current system, people can navigate the virtual classroom as a student or as an instructor through the use of keyboard inputs. In this project, we have also implemented an avatar with VR head-mounted displays. We have created three videos and added them to the environments. The first video contains basic information about the Corona virus. The second video gives information about classroom training and precautions to students. The third video gives information about virtual classroom information. The proximity sensor and timer functions are used for the avatar and virus model in the environment. The environment is also created with clear sky and three audio sound files and necessary 3D avatar models with animation.

## **Accomplishment:**

- In this project, virtual environment is created with clear sky model, Corona Virus models, avatar models (10), pigeons(10), mobile university wellness care unit, emergency ambulance and virtual class room for precaution and online training unit .
- Three video files are added to environment. Video1- For virtual class room training. The Key control-1 to start video, and Key control-2 to stop video. Video-2 is created for Corona virus information and precautions to students, Key control-3 to start video and Key control-4 to stop video, Video-3 is created to give basic virus information its spread to different host.
- The environment is added with bird eye window view.
- Male avatar and female avatar with different animations are added to environment.
- The proximity sensor and timer function is added to Corona virus model and female avatar
- The different key functionality such as Space key bar to increase corona virus environment, w – to move avatar to different location camp. S- To separate avatar and keep safe distance between avatar. t- to see text on the avatar. d- to see proximity sensor, n- to start audio, m- to stop audio. Mouse click – to see environment.
- The environment is added with scroll bar to move avatar instruction and corona virus model.
- The environment is also added with login page to join Virtual class room environment and basic text messages to chat with students and instructor.

The figure above shows the environment added to project.

The figure above shows the avatar + Corona virus + environment

**Future development:**

- Add few function virtual class animation training.
- More animation to Corona Virus model and Avatar Animations.
